1. Executive Summary

This is a prototype deliverable that provides details on the distributed implementation of the CoherentPaaS Complex Event Processing engine (CEP). A complete description of the CoherentPaaS architecture can be found in deliverable "D7.1 - Table-oriented cloud CEP design" [1].

This deliverable describes the parallelization technique used to deploy parallel-distributed queries and details the changes implemented in the CEP streaming operators to support the parallelization.

The deliverable reports also about the integration of CoherentPaaS CEP with the holistic transaction management. This integration allows CoherentPaaS CEP to run queries processing both live tuples and stored events assuring read and write consistency.
